From my run with do_input_feeding, the training time is much faster (1 epoch takes approximately 10 minutes). This is due to the fact that parallel training is allowed.
However, BLEU scores are lower (roughly 0.031, 0.035, 0.038). Also, the predictions are repetitive and are weakly aligned with the inputs. For example:
Input : 홀리 트리니티 교회는 웨드모어 돌로 지어졌으며, 프리 스톤 장식과 슬레이트 지붕을 갖추고 있습니다. 교회는 갤러리가 있는 내부, 제단, 사제관, 서쪽 현관으로 구성되어 있습니다. 지붕 중앙에는 한 개의 종이 들어있는 아케이드 큐폴라가 있으며, 십자형으로 장식되어 있습니다. 교회는 팔각형 평면으로 지어졌으며, 각 면에 돌출된 날개가 있습니다.
Pred : On an clored in the Concolect of Saste teams that II was totan aucized extraly müed in Fice staries, muss, articences in the after yames located in the season to diist of the boxjors, Fine, has beed
Ref : Holy Trinity Church is built of rendered Wedmore stone, with freestone dressings and a slate roof. The church is made up of a nave with gallery, chancel, vestry and west porch. The centre of the roof has an arcaded

When do_input_feeding = True, the training time is slower (1 epoch takes around 40 minutes). This is because it relies on sequential training (the loop for t in sequence), significantly increases computation time.
Also, the predictions are even more repetitive and aren't related to the ground truth. When input feeding is enabled, the model becomes even more unstable because it reuses previous attention context at each step For example
